

A System Integration Solution

We have recognized for some time that we have not been able to service all of your needs with our range of modular panels and enclosures, that we needed to expand our services to include **custom panels**.

Now with the addition to our manufacturing facility of a high speed milling machine (Datron Dynamics) we can now produce custom panels in a wide selection of non-ferrous material.

It therefore gives us great pleasure to introducing a **new** service to you, **Custom Panel System (CPS)**. Now offering custom Aluminum and Composite panels in any size and shape up to 24" by 36". Standard panel thickness is 1/8" for the Aluminum

and 3mm for the Composite (picture to the left). Other materials and thickness can be specified.

Traditionally the finish of the Aluminum panels is brushed and black anodized, other finishes are available on request. The Composite material is finished in matte black, white, and silver or brushed silver.

Panels are supplied as blanks, blanks with machined cutouts for connectors and/or controls, blanks complete with connectors and/or controls and engraving to your specification.

The advantage of using our Composite material is **SPEED**. We can now produce custom panels in days instead of weeks, because the finish is built into the material.

The Composite material we use is made of two strong sheets of 0.012" aluminum bonded to a solid polyethylene core. This laminated construction

produces a rigid and durable product that will stand up to the rigors of every day use.

Simply email us your drawing file in any of the following format: .dwg, .dxf (2D), .eps, .ai, .vnd, .bmp or .wmf. And we'll be able to machine a panel to match the drawing.

If you have any questions or need additional information on this service please don't hesitate to contact us.
