

***We now offer a Label Strip Option for all our 19" Rack Panels.
Part number extension is"- LBL"***

Using the Low Profile Label Strip developed for our MPS Lite product range we can now offer Label Strips as an Option for all our 19" Rack Panels, installed in singles or multiple as the need demands.

These black anodized Label Strips are comprised of an aluminum extrusion, a clear protective lens, a set of circular mounting clips and a pair of rubber stops.

A printed label is cut and inserted into the extrusion before the protective lens is installed. Then the assembly is clipped onto the circular mounting clips installed in the panel. Generally (3) circular clips are used per Label Strip for a 19" Rack panel.

Installed at either end of each Label Strip is a black rubber stop that prevents the printed label from sliding out of the extrusion and provides a neat finish to the assembly.

These low profile Label Strips are 0.1875" thick and 0.400" tall which allows enough vertical space to mount an XLR on a 1RU panel, (2) Label Strips and (2) XLR's on a 2RU panel, (3) Label Strips and (3) XLR's on a 3RU panel, etc.

Because of the low profile design the Label Strip can be installed against the body of XLR and will not obstruct the push-tab of the female connector.
